FIG. 5. Comparison of direct-repeat sequences consisting of 61 base pairs in the 3'-end flanking region of *iap*. The 29 highly conserved nucleotides, which contain a dyad symmetry of 14 base pairs (underlined), are shown at the bottom. Homologous nucleotides found in at least two DNA segments are shown in boldface type. The second translational termination codon is boxed. The nucleotide numbers are in parentheses.

“The biological significance of these sequences is not known.”

- ❖ Similar patterns were found in many other species of bacteria.
- ❖ By 2002, this pattern had a name, CRISPR (clustered regularly interspaced short palindromic repeats).
- ❖ Nearby Cas (CRISPR-associated) genes were also described.

But CRISPR/Cas was still a curiosity, with no known function.

CRISPR/CAS, the immune system of bacteria

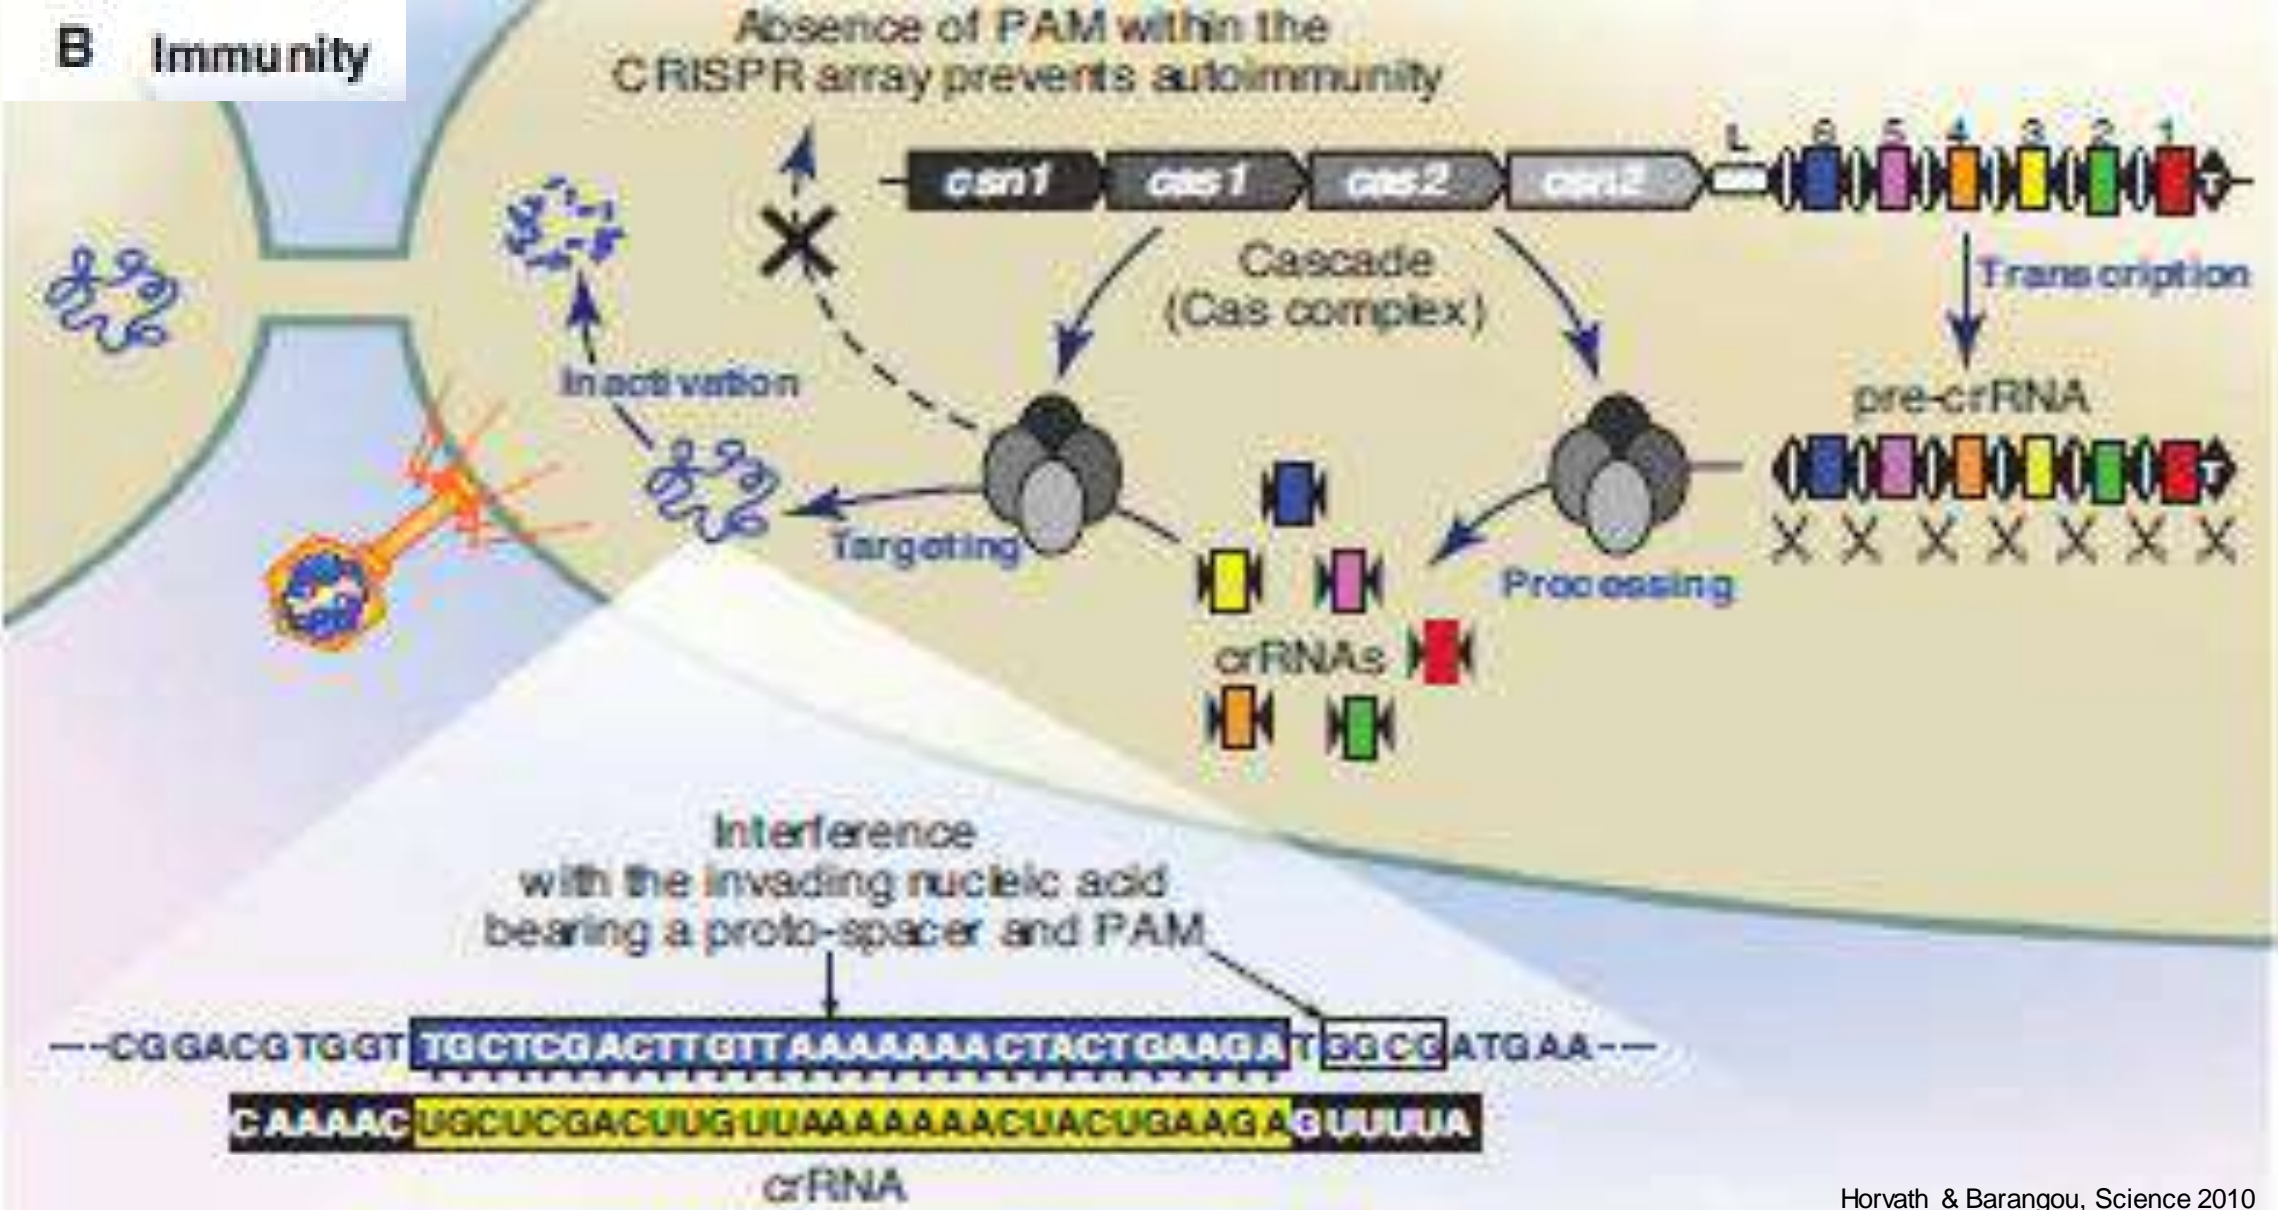

CRISPR Provides Acquired Resistance Against Viruses in Prokaryotes

CRISPR/CAS system types

CRISPR/CAS system types

CRISPR/CAS system type I

a Type I

CRISPR/CAS system type II

b Type II

CRISPR/CAS system type III

c Type III

Type II of CRISPR / CAS system

A Genomic CRISPR locus

B tracrRNA:crRNA co-maturation and Cas9 co-complex formation

C RNA-guided cleavage of target DNA

CAS proteins

Type I-E (*Escherichia coli*)

Type II-B (*Streptococcus thermophilus*)

Type III-B (*Pyrococcus furiosus*)

Protein type

Protein	Distribution	Process	Function
Cas1	Universal	Spacer acquisition	DNase, not sequence specific, can bind RNA; present in all Types; structure available for several Cas 1 proteins
Cas2	Universal	Spacer acquisition	Small RNase specific to U-rich regions; present in all Types; structure available from <i>Thermus thermophilus</i> and <i>Sulfolobus solfataricus</i> and others
Cas3	Type I signature	Target interference	DNA helicase; most proteins have a fusion to HD nuclease
Cas4	Type I, II	Spacer acquisition	RecB-like nuclease with exonuclease activity homologous to RecB
Cas5	Type I	crRNA expression	RAMP protein, endoribonuclease involved in crRNA biogenesis; part of CASCADE
Cas6	Type I, III	crRNA expression	RAMP protein, endoribonuclease involved in crRNA biogenesis; part of CASCADE; structure available from <i>P. furiosus</i>
Cas7	Type I	crRNA expression	RAMP protein, endoribonuclease involved in crRNA biogenesis; part of CASCADE
Cas8	Type I	crRNA expression	Large protein with McrA/HNH-nuclease domain and RuvC-like nuclease; part of CASCADE
Cas9	Type II signature	Target interference	Large multidomain protein with McrA-HNH nuclease domain and RuvC-like nuclease domain; necessary for interference and target cleavage
Cas10	Type III signature	crRNA expression and interference	HD nuclease domain, palm domain, Zn ribbon; some homologies with CASCADE elements

Different Cas proteins

Web resources for CRISPR analysis

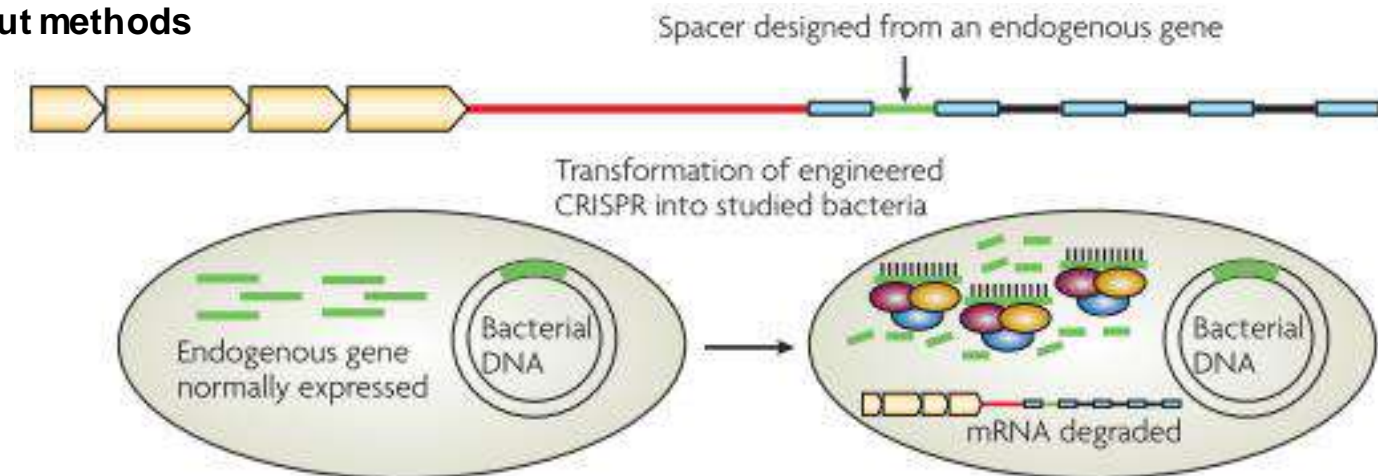

Resource and web page	Description
PILER-CR; http://www.drive5.com/pilercr/	A software tool for the detection of CRISPRs in microbial genomic sequences; based on local alignments in the genome that are represented by mathematical graphs*
CRISPR Recognition Tool; http://www.room220.com/crt/	A software tool for the detection of CRISPRs in microbial genomic sequences; based on the detection of exact k-mer matches that are separated by similar distances*
CRISPRFinder; http://crispr.u-psud.fr/crispr/	A software tool for the detection of CRISPRs in microbial genomic sequences; based on enhanced suffix arrays*
CRISPRdb; http://crispr.u-psud.fr/crispr/	Automatically updated database of CRISPR arrays in published microbial genomes; also contains CRISPR analysis tools that allow the alignment and comparison of repeats and spacers against the public databases
Pygram; http://www.irisa.fr/symbiose/projets/Modulome/article.php?id_article=18	Visualization application that provides a graphical browser for studying repeats
TIGR Comprehensive Microbial Resource; http://rice.tigr.org/tigr-scripts/CMR2/genome_property.spl?subproperty=CRISPR%20region!&select_count=1	Provides a 'clickable' table that depicts, for each sequenced genome, the presence or absence of the 45 Cas protein families that are defined in Ref. 17

Early applications of CRISPR

❖ Engineering of phage resistance into sensitive industrial bacteria

❖ Silencing of endogenous genes as an alternative to knockout methods

- ❖ A crucial first step for performing targeted genome editing is the creation of a DSB at the genomic locus to be modified.

Mechanism of site specific integration

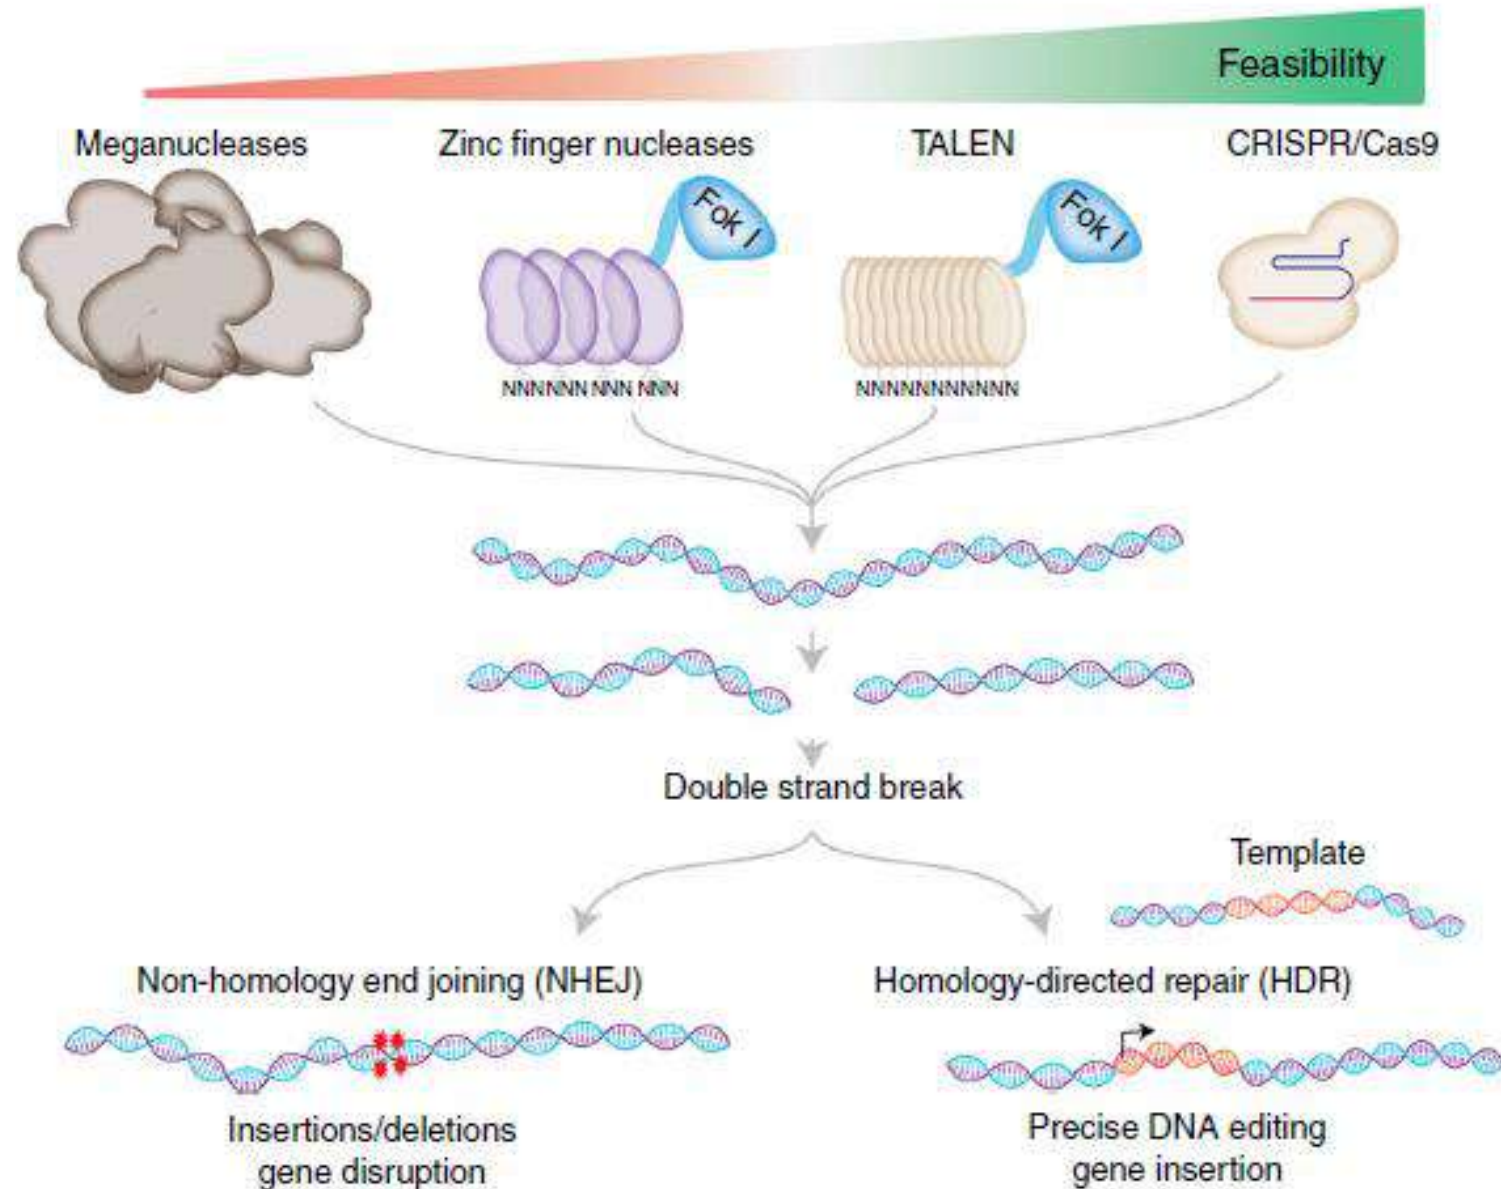

- ❖ DSBs can be repaired by one of at least two different pathways that operate in nearly all cell types and organisms: homology directed repair (HDR) and non-homologous end-joining (NHEJ)

Using CRISPR/Cas for DSB creation

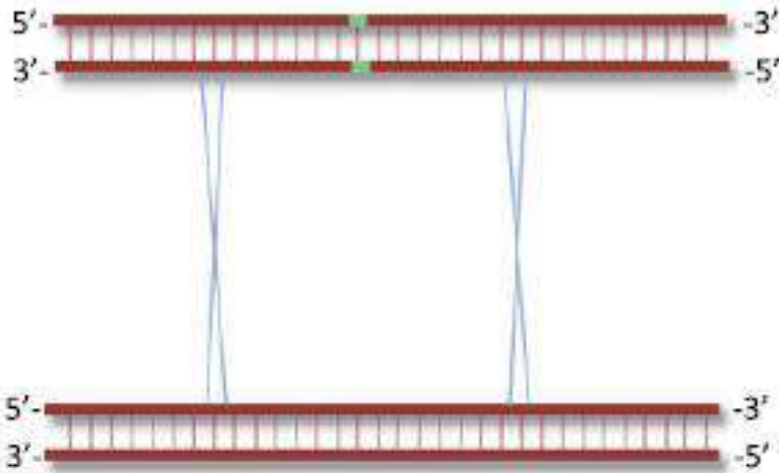

Other strategies for DSB creation

New strategies for site specific genome engineering

Conventional Gene Targeting

Walsh & Hochedlinger, PNAS 2013

- Complex
- Time-consuming
- Low efficiency

ZFNs and TALENs

- High efficiency (1- 50 %)
- Complex
- Time-consuming design

CRISPR/SpCas9

- Facile design
- High efficiency

Zinc finger nuclease (ZFN)

❖ **Each ZFN is composed of:**

- A zinc-finger protein (ZFP) at the amino terminus
- The FokI nuclease domain at the carboxyl terminus

Transcription activator-like effector nuclease (TALEN)

❖ Each TALEN is composed of:

Transcription activator-like effectors (TALEs) at the amino terminus
The *FokI* nuclease domain at the carboxyl terminus

- ❖ Each TALE repeat is comprised of 33–35 amino acids and recognizes a single base pair through the amino acids at positions 12 and 13, which is called the repeat variable di-residue (RVD).

Clustered Regularly Interspaced Short Palindromic Repeats (CRISPR) / CRISPR Associated Protein (CAS)

❖ RNA Guided Nuclease (RGN)

Cas9 modifications

**Depression of off-targets
Enhancement of specificity**

Cpf1 as an alternative for Cas9

Cell

Cpf1 Is a Single RNA-Guided Endonuclease of a Class 2 CRISPR-Cas System

Bernd Zetsche,^{1,2,3,4,5,10} Jonathan S. Gootenberg,^{1,2,3,4,6,10} Omar O. Abudayyeh,^{1,2,3,4} Ian M. Slaymaker,^{1,2,3,4} Kira S. Makarova,⁷ Patrick Essletzbichler,^{1,2,3,4} Sara E. Volz,^{1,2,3,4} Julia Joung,^{1,2,3,4} John van der Oost,⁸ Aviv Regev,^{1,9} Eugene V. Koonin,⁷ and Feng Zhang^{1,2,3,4,*}

Cell 163, 1–13, October 22, 2015 ©2015 Elsevier Inc.

- ❖ This feature could simplify the design and delivery of genome-editing tools. For example, the shorter (42 nt) crRNA employed by Cpf1 has practical advantages over the long (100 nt) guide RNA in Cas9-based systems because shorter RNA oligos are significantly **easier and cheaper to synthesize**.
- ❖ Cpf1 generates a staggered cut with a 50 overhang, in contrast to the blunt ends generated by Cas9. This structure of the cleavage product could be particularly advantageous for facilitating nonhomologous end joining (NHEJ)-based gene insertion into the mammalian genome. Being able to program the exact sequence of a sticky end would allow researchers to design the DNA insert so that it integrates into the genome in the proper orientation. Specifically, in non-dividing cells, in which genome editing via homology-directed repair (HDR) mechanisms is especially challenging, Cpf1 could provide an effective way to precisely introduce DNA into the genome via non-HDR mechanisms.
